As I continue my theory on curing cancer I wish to further CYA my position. I am not a medical doctor, thank god actually, because the malpractice insurance would drive me nuts. Also since I am not in the medical field at all you cannot sue me for this idea, concept of mine. Now then continuing Part III.

As I continue my theory on curing cancer I wish to further CYA my position. I am not a medical doctor, thank god actually, because the malpractice insurance would drive me nuts. Also since I am not in the medical field at all you cannot sue me for this idea, concept of mine. Now then continuing Part III.

Chemo that is directly induced where needed might work, but we have better technology now and could use specific fluid dynamic beams of energy or radiation pointed at the exact source and area or even non-evasive light. Now then here is some additional information: it is now possible to send thoughts by fax through three-dimensional spatial representation of the brain in hologram video. We have hologram faxing available and Brain Surgeons are using this to show damage in the brain. The guy who thought of it had my friend in Malibu working for his company in LA. Now they can transmit this data by fax, three-dimensional faxing, like sending a cad cam design computer, but you can now fax it with special machinery.

Now we maybe able to use this same idea to send a thought. This relates to my theory of cancer curing so follow along. Wow, eventually the devise would be very small the size of a dime or so to send and receive data or thoughts by way of this devise, this is way in the future, but it could be available to the common man in 20 years or so. Now before this technology gets this small and nano-tech achieves these seemingly impossible feats we can use the basic concept to record a thought for my cancer experiment.

Now just think about this for a second. There have been cancer survivors with very positive thought patterns and attitudes and part of the reason they lived and others died may have been just that. We must mirror these thoughts of strength, character and attitude and place these thought patterns in those who do not have them. We can look into the thought patterns of many cancer survivors and take those and average them and mimic them and place them in the patients. Duplicate them with TMS through fMRI scanning and send those impulses to those areas of the brain of the patient.

Strong patients will be best since those thought patterns can converge. All we have to do is isolate the things I have discussed before in my many articles and in my brain research with regards to the 10,000 chemicals of the brain 2000 interacting at any one time and 200 prevalent. Take the ten strongest components of the 200 and experiment with them. What we are looking for in those miraculous cases, why did they survive, what makes them different, why do some die and others live? We look at the brain areas which light up and release the cancer fighting biological components in each strong willed survivor. We find common ground and record it, then hook a machine up to stimulate those parts of the brain in the other cancer fighting folks.

First we try the first experiment by placing thought of one persons brain into that of another, and yes as strange as this sounds I do believe it is totally possible and as the future marches on, very probable. This experiment to prove my hypothesis takes two people from the same mom, preferably brothers or sisters of the same mom and dad and hopefully born within a short time frame (2-3 years). Grew up and were nurtured by the same parents. Similar birth dates. Twins would also be good for this. To prove my experiment first You separate the twins by 4000 miles but both at the same altitude preferably sea level. Similar longitude with similar magnetic pulls and similar gravity pull of the Earth this will make sure that the oxygen level in the brain is similar and it will be a non-artificial environment, not a clean room.

Next You then hook up a brain scanner that records a thought, a complex one, simple one first time. Then record where in the brain the energy is located in sequence during the thought. This is done all the time. It will take a controlled thought and focused thought at first. Next you send the digital thought sequences to the other coast. You could also fax that three-dimensional model to the East Coast or Pacific side or where you are, and hook up the data and the model to the brother or sister. And recreate the exact impulses where they occurred in the last person on the west coast or East Coast. Provided the diets are similar and the intake is similar, oxygen level, basic genetics are similar, you should have it. The same basic thought. Recorded transferred and sent and then duplicated, Thought transfer.

Now that would be a worthy accomplishment in itself but the possibilities for cancer fighting would be amazing indeed. Now obviously you do not reveal the thought to the other person, let them tell you what the thought is or was. A thought is recorded and therefore timeless. Thoughts can travel through time at least we can travel thoughts to the future. Just like knowledge. Or at least this has been theorized by many including Einstein. Now for my experiment once concept of thought transfer is proven: Now after this is done, you take a cancer survivors abilities of focusing in their own your body, mimic the diet and intake of that person with the patient anywhere in the world.

End of Part III
